

Some real facts that MAN-MADE global warming advocates will never show you.

99% of warming advocates don't understand any of the real facts or history and just follow the man-made warming propaganda released by the IPCC like a religion. But the facts do not lie. I beg those people to actually READ this to get a more realistic perspective.

This (below) is the famous IPCC HOCKEY STICK GRAPH

This is the main IPCC scientific evidence, a scare story, showing how the planet is warming based on the last 1000 years.

They claim that this temperature and CO2 spike is unusual and abnormally fast. However, there's very little evidence that it is caused by human added CO2. Although a tiny part of it may well be. Of course, man doesn't make CO2 but he does release it back into the atmosphere, where it had been stored up by trees and plants that turned to oil, coal and gas a long time ago.

This graph and what it attempts to show, is what the IPCC, all of the media and other alarmists concentrate on. This is their smoking gun evidence, that has persuaded most people that don't know the facts and politicians too, that global warming is a huge problem. And that we are causing it. Or rather some of it. The current CO2 level is just 0.04% of the atmosphere. Less than a half of 1/10th of 1%. And we are responsible for only a tiny fraction of this. Most of it is completely naturally caused.

This is their evidence for climate change. Which IS real. Climate change has always happened. Prediction for future rises are likely very much over estimated.

You will see this same alarmist hockey stick graph, all over the TV, and other media. They don't tell you that CO2 levels increase naturally as it boils out of warming seas, volcanos, every microbe and animal, & rotting vegetation on the planet.

CO2 increase in the atmosphere (as miniscule as it is), far from being a *cause*, may in fact be a *symptom* of the natural warming as a great many non IPCC scientists think. In any case human made CO2 is just a tiny fraction of the CO2 produced by planet earth. And CO2 is only one of many far more powerful greenhouse gasses. Like water vapour. Nitrous Oxides, etc.

Every global warming website on the internet, and every single release from the IPCC, has this exact same cherry-picked graph. Showing just the last 1000 years. Ever wondered why this is? That's easy. This cherry picked 1000 years looks great for their case!

Looks scary? That's a very BIG upward temperature spike they show (above), and will cause all sorts of mayhem, suffering and death & destruction (they claim). Let's build wind farms, buy electric cars, tax fuel to death, & strangle industry with super expensive fuel and regulations. Making our society poorer.

That is, until we look at the REST of this temperature graph, over a longer time period. The part they *never* show on the media or press releases. Why is this? Because it makes their claims look ridiculous.

This new graph below is over a *slightly* LONGER TERM, drawn from the very **SAME ice core sample data as above, but now shows 10x further in time. **Instead of the last 1000 years, let's look at 10,000 years. The blink of an eye in historic terms.****

Not so impressive now is it! That huge **Red** spike no longer looks sudden, steep, or unusual *in any way*. It is in fact insignificant. It's the last and lowest part of the graph. And that 'scary' red spike representing the ridiculous global warming hysteria, is marked in red. And shows how ridiculous all this 'climate emergency nonsense, and overhyped media panic really is.

This puts it into perspective. Our kids come out of schools and colleges with this 1000 year nonsense brainwashed into them. They don't look at the real longer-term facts. They just 'know' that GW is real! They were taught this while young. Plastic brains believe what they are told. That's how religion works. The left has a lot to answer for. But any dissent even by scientists is ridiculed and shut down or 'cancelled'. Any discussion is no longer allowed. And it's getting worse.

So far from being a scary & massive change as described by the left and the warmist's, it's now just a tiny insignificant blip in the scheme of things. Nothing unusual at all. Can you now see why they only show you this last 1000 years? Climate emergency? Now you see how stupid that claim really is. Overall average temperature has fallen over time! Once the noise is smoothed out. LOOK at the graphs. The current warming is insignificant in any way. And probably beneficial.

This planets temperature varies hugely over longer time periods, and it did so long before we ever started burning any fuel. And before humans existed. And carbon dioxide has always FOLLOWED it. Long before any industry. And 10,000 years is just a blink of the eye in the 4.7 billion years actual age of the planet. Global temperatures are not stable. They never will be.

So let's now look at how that huge scary warming spike looks, if we look at the temperature records going back a bit further still.

This is the same graph data. But it now shows just 5 million years

The serious **scary red spike** that is "global warming" is now simply invisible. If

we could see it, it would be a single red pixel at the very lowest COLDEST point on this graph on the right hand side.

The hockey stick graphs the IPCC and other media, school, college alarmists keep showing the world at the start of this document are **DESIGNED** to deceive the easily persuaded. The gullible. The ignorant. Its chosen only to make the temperature rise significant and scare people into the green, left, socialist agenda. They hate capitalism. This is their latest attempt to try and destroy it. Because nobody today would vote socialist as it has shown itself to be an evil thing. So hey are now using different methods to destroy our way of life.

It's all about cherry picking that tiny bit of the graph just right at the end. Because that LOOKS so *impressive* to the ignorant masses. Those that do not know the real facts about CO2 or temperature over longer time periods. As you now do.

It varies naturally by huge amounts along with CO2 and it does so to much greater extremes than we see today. And it always has. Long before we came along. Humans are 10,000 years old. We burned a few sticks and were a few million people for most of that time.

So how does the picture look if we go back to say, when the dinosaurs had just died out? Still relatively recent history in geological time scales, at 65 million years. Still nothing compared to the earths 4.7 Billion year age.

That 'huge' red spike we saw on the first IPCC graph, with that 'scary' temperature rise is no longer visible. It would be at the very BOTTOM of this graph, on the right, would be much smaller than one single pixel, at roughly the lowest, and coldest point. Lost in the noise. Not quite so scary or significant now is it! Or even unusual... In fact long term, we are quite likely due another really long ice age.

Now...

1. Since most of this planet real history is one of extremely long ICE AGES with literally miles of depth of solid ice, as far south as New York, and there are only relatively brief warm periods, how significant is that tiny short red spike on the IPCC cherry picked 1000-year graph? Is it important? It's only important if you look at the Earth's temperature over the equivalent of around the last 1 second out of a full 10 years. It's totally meaningless! Like looking for trends in house prices over the last 24 hours.
2. Plant life, grows faster (and so locks up any CO2 we may produce) as algae, green growth and wood, and subsequently turns it into oil and gas long term. Taking any extra CO2 out of the system anyway. And when warmer everything green grows further north and south as the planet warms. Green life and animal life flourishes during these brief warm periods. Plants need this tiny 0.04% CO2 to breathe! It's what they live on. Some grow better and faster with a little more CO2 and at higher temperatures. So, the planet and life on it, is controlling any CO2 warming quite naturally by locking it back up long term.

And animals do well too when warmer. Including man. Mammals become more abundant, cover larger areas of the planet and more new animal species appear in warmer times. Life flourishes. And also spread further north and south on the globe during the warmer periods.

So then, who says warmer is WORSE, anyway? Certainly, the opposite is true historically. There is a LOT of real evidence showing the exact opposite is true historically. Growing food to feed our planets huge 8 billion and growing population will be easier to begin with. Less fuel needed for heat. Greater amount of wildlife to hunt and farming becomes easier and more productive over larger areas of the planet – the previously non-fertile cold areas.

Yes, climate change always happens, it may change the weather and sea levels *slightly*, very long term. (Or it may not. It certainly didn't change sea levels that much in the past – even in vastly greater temperatures.)

We are repeatedly told of terrible predictions. The sky is falling. When these don't happen, they just make more new ones!!!

We were all told by the IPCC and the United Nations in 1979 that within 7 to 10 years the Maldives' islands would be under water. **FORTY YEARS** later the people are still sunbathing on the very same beaches as they always did. NOTHING has changed. The ever more shrill claims and threats never actually occur. Its all massively overblown hysteria. Do any of these hysterical warmist's explain these predictions (theres many) that never happened? No they neither apologise or admit they were wrong. Instead they just ignore them and make ever more ridiculous claims.

We were told in the 90s that the north pole's sea ice would be completely gone by 2012. And its barely changed in 2021. As usual all the extreme predictions designed to scare the ignorant have proven to be completely nonsense. These are the FACTS and not some ignorant warmist's belief system. And when/if it does eventually melt, it will be nothing new. It's been much hotter countless times in the past. And nothing we can ever do will change this. Since it happened countless times long before there even were humans.

Sea defences as used in many parts of the world inc where I live, or Holland etc, and other remedies like moving people further inland longer term, or refusing planning in low lying areas of land, over a few hundred years. If coastlines do change may or may not, be required.

But the benefits of a naturally warming planet may well far outweigh the other issues. And the endless screaming about the sky falling is frankly ridiculous.

Climate change has been happening for billions of years and to a MUCH larger degree than the IPCC's cherry picked hockey stick graphs show. And at way greater levels than any IPCC prediction ever made. And just as fast or even faster temperature changes. And you cannot ever stop it. It's simply what this planet does. Climate changes severely, and quickly. It always has done. They just don't show you this. Its not a thing that we COULD prevent even if we bankrupt ourselves trying. Its like the fleas on a dog thinking they can steer it.

So why are we bankrupting our society, charging a fortune for fuel by subsidising green windmills or banning gas heating, etc. And stifling and damaging industry, wasting money on subsidising such things as electric cars. Charged by coal power stations in most of the world! That we are pointlessly destroying as fast as possible. Already done in the UK which is why we now buy lots of our electricity and gas from overseas. We do not make enough power in the UK. So now pay approx. 3x more for fuel than many other countries And all for nothing.
